Newport Milestones/Facts

Milestone Dates

- 1962-1968: Newport manufactures all chemical agent VX for U.S. defense stockpile
- 1969: President Richard Nixon issues a unilateral decree halting production and transport of chemical weapons, including last two lots of VX produced at Newport
- 1999: Army awards systems contract to Parsons Corporation of Pasadena, Calif. to design, construct and operate NECDF
- 2003: Construction complete
- 2005: Agent destruction operations begin May 5, 2005

Steel Container Transport

Chemical Agent Transfer System

Neutralization Reactor

Carbon Filtration Units

Using neutralization technology, NECDF has safely destroyed:

Approximately 135,784 pounds (approximately 16,118 gallons)

Activities: Workers at the Newport Chemical Agent Disposal Facility have worked 802 days without a job-related injury or illness resulting in a day away from work. Workers are conducting routine maintenance of the neutralization facility. The routine reactor maintenance and sample system upgrade to an automated system is scheduled for completion January 15. Construction of an additional intermodal container storage area continues on schedule. The first phase of this construction is scheduled for completion in late March.

Continuing the Legacy of Safety

The Newport team continues to build upon their legacy of safety—from chemical agent manufacture and shipment in the 1960s, to nearly 40 years of safe storage, to the start of agent destruction operations. By safely eliminating Newport's chemical agent stockpile, the workers at NECDF will remove the risk posed by continued storage of the stockpile. The United States will be safer due to the efforts of the Newport team.

- Our top priority remains the safety of the surrounding communities, site personnel and environment.
- During start-up, deliberate actions and thorough review of data will be conducted to verify performance before increasing production rates.
- Processing areas are ventilated and maintained under negative pressure. Air drawn from these areas is controlled, monitored and filtered through carbon units before being released into the environment in order to meet state and federal clean air standards.
- Monitoring air within the depot is a vital part of processing chemical agent. More than 70 chemical agent monitors are placed in and around the facility, with approximately 4,000 samples taken daily.
